

Stunning Visualizations that Provide True Business Intelligence

N'view is a software-based solution that translates raw, disparate data points into stunning visualizations—providing true Business Intelligence. Using an array of networked sensors within your datacenter, N'view generates real-time utilization maps. These visualizations provide immediate and ongoing day-to-day benefits, allowing data center utilization to be more effectively balanced. N'view also plays a key role in your capacity management process, providing the trending and historical information necessary for a comprehensive capacity plan. N'view helps remove the guesswork and intuition from your decision making process, so you can quickly and accurately manage your data center—both now and in the future.

Benefits

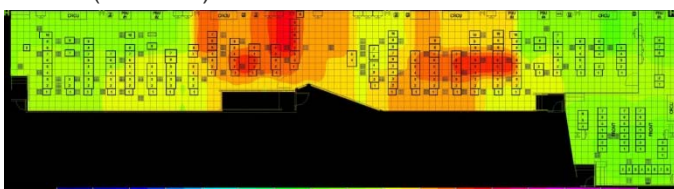

- Visualizations provide an easy-to-understand status of your data center that facilities, IT, and management can all understand.
- N'view graphically presents your data center resources—power, space, and cooling. It combines these visuals into a true view of your data center's health.
- Improved capacity management process through N'view's historical and trending capabilities
- Based on usage patterns, N'view helps estimate the lifespan of your data center.
- N'view lets you visualize the overall capacity of your data center, as well as any critical constraints.
- Too often, an excess of data can mean important information gets overlooked. N'view solves that problem by making key information visually obvious.
- Manage your data center on a day-to-day basis using actionable data, not intuition.

The N'view user interface is easy to navigate and makes key information visually obvious.

These before and after snapshots show how an N'compass client was able to identify and communicate hotspots so decision makers could make critical changes to their data center.
